# Clash & Coordination

Clash detection and collaboration environment enabling agencies to coordinate works and protect routes from disruption.

Seeing the wood for the trees

one.network is the UK's highway coordination and collaboration platform. Our database is the most comprehensive resource of planned roadworks, traffic management interventions, events and unplanned incidents.

one.network is used by thousands of highways professionals every day to coordinate activities on our roads. Much of this is done visually using the one.network map. The Clash & Coordination module automates the process, sifting hundreds of thousands of data items in order to highlight potential clashes in an easy to use dashboard.

The Clash & Coordination dashboard is highly configurable, making it suitable for a wide variety of activities from streetworks coordination and bus route protection right through to the macro coordination of major projects and identifying opportunities for collaboration.
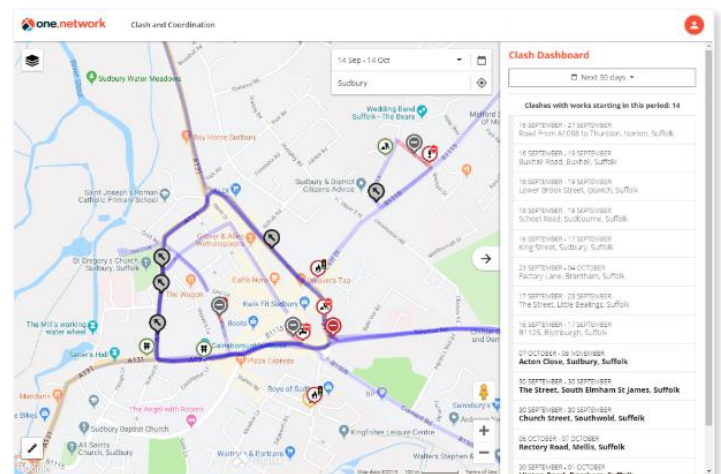

Use cases

- Streetworks coordination
- Advanced warning of disruption to bus routes
- Protection of construction/special access routes
- Regional coordination of major projects

Features & benefits

- Automatic detection of works and traffic management conflicts.
- Receive alerts about works and diversion routes affecting your predefined routes or locations
- Fully configurable clash detection: set which types of works, traffic management and other information you want to be alerted to
- User friendly dashboard enables clashes to be sorted, filtered and flagged, making decision making simple

If you would like to know more about the Clash & Coordination module and arrange a demo, please contact us.
